Press Release

The Server Labs becomes official partner of Amazon Web Services

Following an increasing level of collaboration, The Server Labs (TSL) and Amazon Web Services (AWS) have closed a partnership deal. Both partners are combining leading cloud infrastructure with the expertise to design and migrate application architectures to the cloud environment. The agreement will be instrumental for companies that want to move swiftly to the cloud whilst increasing their competitiveness.

Madrid, Spain, 1, February, 2010: The Server Labs (TSL), European IT company and leader in Cloud Computing architecture services, announced today the signing of a partnership agreement with Amazon Web Services (AWS), the leading provider of elastic IT infrastructure services for companies of all sizes.

The partnership with The Server Labs will allow businesses to tap into the vast possibilities of Cloud computing. The partnership will combine the strengths of both companies, bringing together Amazon's infrastructure web service platform in the cloud and The Server Labs' expertise to design and develop application architectures enabling an effective use of cloud services.

With their hands-on expertise in architecture services, The Server Labs will support companies to move even the most complex applications to the cloud environment. Although many enterprises do not doubt anymore the opportunities arising with the cloud, they often lack the knowledge to deploy and migrate their applications to a cloud environment.

"We really look forward to starting a more formal and active cooperation with Amazon. Based on the experience of our previous interaction I am confident that this partnership will bring many successful opportunities, and that together we will be able to leverage the power of Amazon's cloud through our Cloud Architecture services. We see our role as helping companies move to the Cloud – a move which will save their business great amounts of money and will sharpen their competitive edge", states Dolores Saiz, CEO and Co-Founder, The Server Labs.
