Press Release

The Server Labs will reform the architecture of BBVA's corporate security application

The Server Labs has been chosen by BBVA to develop a completely revised version of its corporate security application Faro in order to unify and streamline the application throughout all countries in which BBVA operates. The new security application, which will cover corporate security management tasks, will be rolled out in four stages.

6th February, 2012: The Server Labs (TSL) has been tasked to design a new flexible, efficient and scalable high quality solution for its security application Faro. The application supports the management of the security functions of the BBVA group including for example dashboards, financial control, incident management, inventories and security personell.

The current application had been serving very well until now, but its base structure is making it increasingly difficult to incorporate new and extended requirements particularly throughout a growing international network.

The new application will be required to function for all countries in which BBVA operates, be easily maintained and providing a high level of usability and scalability.

One of the key prerequisites the application must comply with is usability. The application must be easy to use and support not only corporate browsers like Firefox 3.6 and IE 8, but also be able to work with Safari in an iPad. Also its flexibility will be of great importance allowing the application to further develop and grow with newly arising requirements whilst keeping associated cost and time consumption low.
The project implementation is planned in for phases covering BBVA's worldwide markets between 2011 and 2014.

"We are delighted to be working with BBVA on its new Faro security application and bringing in our expertise in complex architectures and Agile development. It is an exciting project which will pay off in the long run, making the management and maintenance of its security functions much easier, transparent and cost efficient all of which is vital for an organisation with an international network as important as BBVA's", sums up Paul Parsons, CTO of The Server Labs.

Notes to the editors:
The Server Labs
The Server Labs (TSL) is a specialist IT Consultancy and Development Company and a leading authority in Cloud Computing services. Founded in 2004, The Server Labs focuses on the design and implementation of IT architectures and advanced software engineering projects, working with the most advanced solutions and technologies and offering its clients cost-effective, scalable and high performance solutions.

TSL's customer groups are predominantly large and medium-sized corporations, which share a growing need for cost effective and scalable IT solutions. TSL has offices in Spain, Germany and the UK. Most recently TSL started partnering with Amazon and RightScale to facilitate the adoption of Cloud Computing in Europe.
