Press release

The Server Labs signs a partnership agreement with RightScale

The Server Labs (TSL) and RightScale are announcing a partnership agreement. The Server Labs have already been collaborating successfully with RightScale on the Gaia project of the European Space Agency (ESA) with complimentary expertise and services. Combining TSL's expertise to design and migrate application architectures to the cloud environment and RightScale's Cloud Management Platform, both partners expect to expand their working relationship, which will add great value for companies seeking support moving to the cloud.

Madrid, Spain, 1st March, 2010: The Server Labs (TSL), European IT services company and leader in Cloud Computing architecture services, announced today the signing of a partnership agreement with RightScale, a leading company in cloud computing management.

Prior to signing the partnership agreement, The Server Labs and RightScale have been collaborating successfully on the prestigious Gaia project of the European Space Agency (ESA). RightScale provided the configuration management with its ServerTemplates technology, which defines how servers will dynamically configure themselves at runtime. The advantage of ServerTemplates lies in their ability to deploy "cloud-ready" servers that know how to operate in the cloud. In addition, the portability of the technology makes it possible that it can be used on any type of cloud.

Bringing together both partners expertise will greatly benefit companies that are moving to the cloud. RightScale's solutions enabling an automation of business-critical applications on the cloud will add to The Server Labs extensive expertise to design and develop application architectures enabling an effective use of cloud services

For the Gaia project the interaction with RightScale meant that several hours of manual configuration needed to associate the 10-disk database with the TSL deployment on a daily basis could be turned into a 10-minute automated process making the progress of the project faster and reducing the risk of man-made errors.

"Having already worked with RightScale on the Gaia project we look forward to a broader cooperation. We are confident that our collaboration with RightScale will add a lot of value to companies that want to use the cloud making their move swifter and smarter.

Combining RightScale's cloud management technology solutions with our hands-on expertise in traditional IT and cloud architecture services, we can take even complex applications in record time to the cloud saving companies time and money", explains Paul Parsons, CTO and Co-Founder, The Server Labs.

Notes to the editors:

The Server Labs

The Server Labs (TSL) is a specialist IT Consultancy and Development Company and a leading authority in Cloud Computing services. Founded in 2004, The Server Labs focuses on the design and implementation of IT architectures and advanced software engineering projects, working with the most advanced solutions and technologies and offering its clients cost-effective, scalable and high performance solutions.

TSL's customer groups are predominantly large and medium-sized corporations, which share a growing need for cost effective and scalable IT solutions. TSL has offices in Spain, Germany and the UK. Most recently TSL started partnering with Amazon and RightScale to facilitate the adoption of Cloud Computing in Europe.
